

## ABSTRACT OF THE DISCLOSURE

A hinge and locking assembly includes first and second hinge members that, when locked, are prevented from rotating about an axis and that, when unlocked, are permitted to rotate about the axis and a lock indicator member movable  
5 between a retracted position when the hinge members are locked and an extended position when the hinge members are unlocked. A user is able to determine whether the hinge members are locked or unlocked by observing whether the lock indicator member is in the retracted position or the extended position.
